November 23, 2019

CSCI 1100

Below is the link to my webpage:

<file:///C:/Users/Diamond%20Clark/Documents/University%20of%20Georgia/Project.html>

Tags Used and Why:

1. Title tag used to change the title of the webpage in the blue bar in the browser. I changed it to Index.html because that is what was preferred in the rubric for the project.
2. Heading tag <h1> was used to show what was going to be discussed on the page. I decided to talk about myself on the page and make it personal.
3. I used a table tag <table> to separate the information on myself and the picture of myself neatly. I wanted them to be side by side.
4. The image tag was used to insert the picture of myself.
5. I inserted hearts (special characters) throughout the page to separate the different sections. This is a symbols tag and added a cute design to the page. This was not discussed in lab.
6. I used paragraph tags <p> to insert the paragraphed information about myself.
7. I used two list tags AND to give bulleted and numbered information about myself, such as the places I would like to travel to and my favorite foods.
8. I added links to the webpage so that the page would give access to my social medias in case someone would want to follow me on social media.
9. I used the caption tag <caption> for the table to indicate what was being discussed in the table.
10. I used the bold tag to emphasize certain information that I thought was important.
11. I added different background colors for each section to make the page more pleasing to look at. It gives the page flavor and makes it less boring.
12. I used font families to make sure that the words were in a certain font. This also adds to the aesthetic of the webpage.
13. I used different font sizes to different between paragraphs and titles.
14. For the heading, I centered the text so that it was clear that it was the heading.
